

# Mapping Wetland Communities within the Missouri River Floodplain

Clayton Blodgett, Ronnie Lea, and David Diamond  
Missouri Resource Assessment Partnership  
School of Natural Resources  
University of Missouri-Columbia

# Objectives

- Increase the accuracy to which wetland areas can be identified using remotely sensed information
- Pilot the use of object oriented remote sensing techniques for the mapping of wetlands

# Methods

- Use a variety of satellite based image products
- Collect remotely sensed information from multiple time periods
- Develop fine scale digital elevation models
- Multi-stage classification system implemented using object oriented approach

## Landsat Thematic Mapper

Collected December 31, 2002

Panchromatic and Multispectral data merged and resampled to 10m spatial resolution

Coincided with low water reading from Missouri River stream gage

Analyzed to determine areas that are permanently flooded

## SPOT 5 Multispectral

Collected April 16, 2007

Native 10m Multispectral data

Desire was to capture the beginning of the growing season

Analyzed to determine system and class attributes of the wetland classification

## SPOT 5 Multispectral

Collected August 13, 2007

Native 10m Multispectral data

Desire was to capture the height of the growing season

Analyzed to determine system and class attributes of the wetland classification

## Radarsat-1 Fine Beam

Collected April 20, 2007

Fine Beam 8m spatial resolution

Desire was to capture vegetation structure

Analyzed to determine system and class attributes of the wetland classification

## USACE Mass Points and Break Lines

Collected 1998 by Horizon, Inc. for  
USACE

Break lines and mass points  
collected

Over 1.2 million points

25 foot postings

## Digital Elevation Model

5m pixel size

Less than 1 foot vertical resolution

## Object Classification Example

Generate objects

# Multi-Stage Classification System

- Classification system consists of multiple stages
  - Wetland system classification
  - Wetland class classification
  - Water regime classification
- Incorporate above stage classifications to develop final classification

## Wetland System Classification

Object generation

## Wetland System Classification

Object  
classification

## Wetland Class Classification

Object generation

## Wetland Class Classification

Object  
classification

# Water Regime Classification

Digital Elevation  
Model

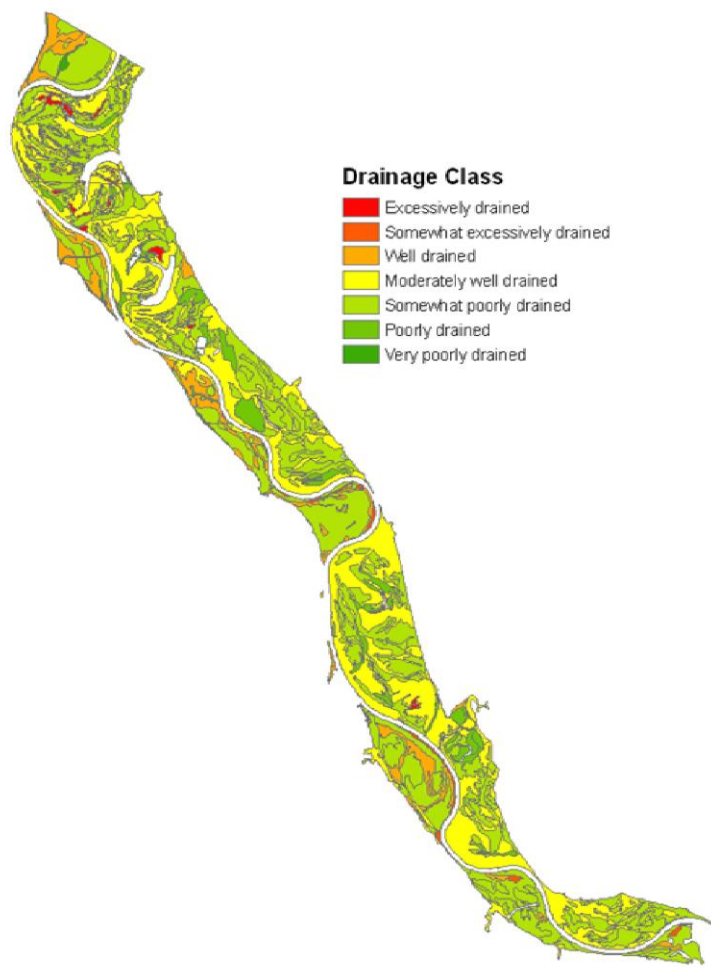

Filled Digital  
Elevation Model

Filled Digital  
Elevation Model  
subtracted from  
Digital Elevation  
Model equals  
Sinks

We think of this  
as ponding  
potential

## Water Regime Classification

SSURGO  
Drainage Class

#### Water Regime in Sinks

- A, Well drained
- A, Moderately well drained
- F, Somewhat poorly drained
- G, Poorly drained
- G, Very poorly drained
- J, Excessively drained
- J, Somewhat excessively drained

#### Water Regime not in Sinks

- A, Very poorly drained
- J, Poorly drained

## Water Regime Classification

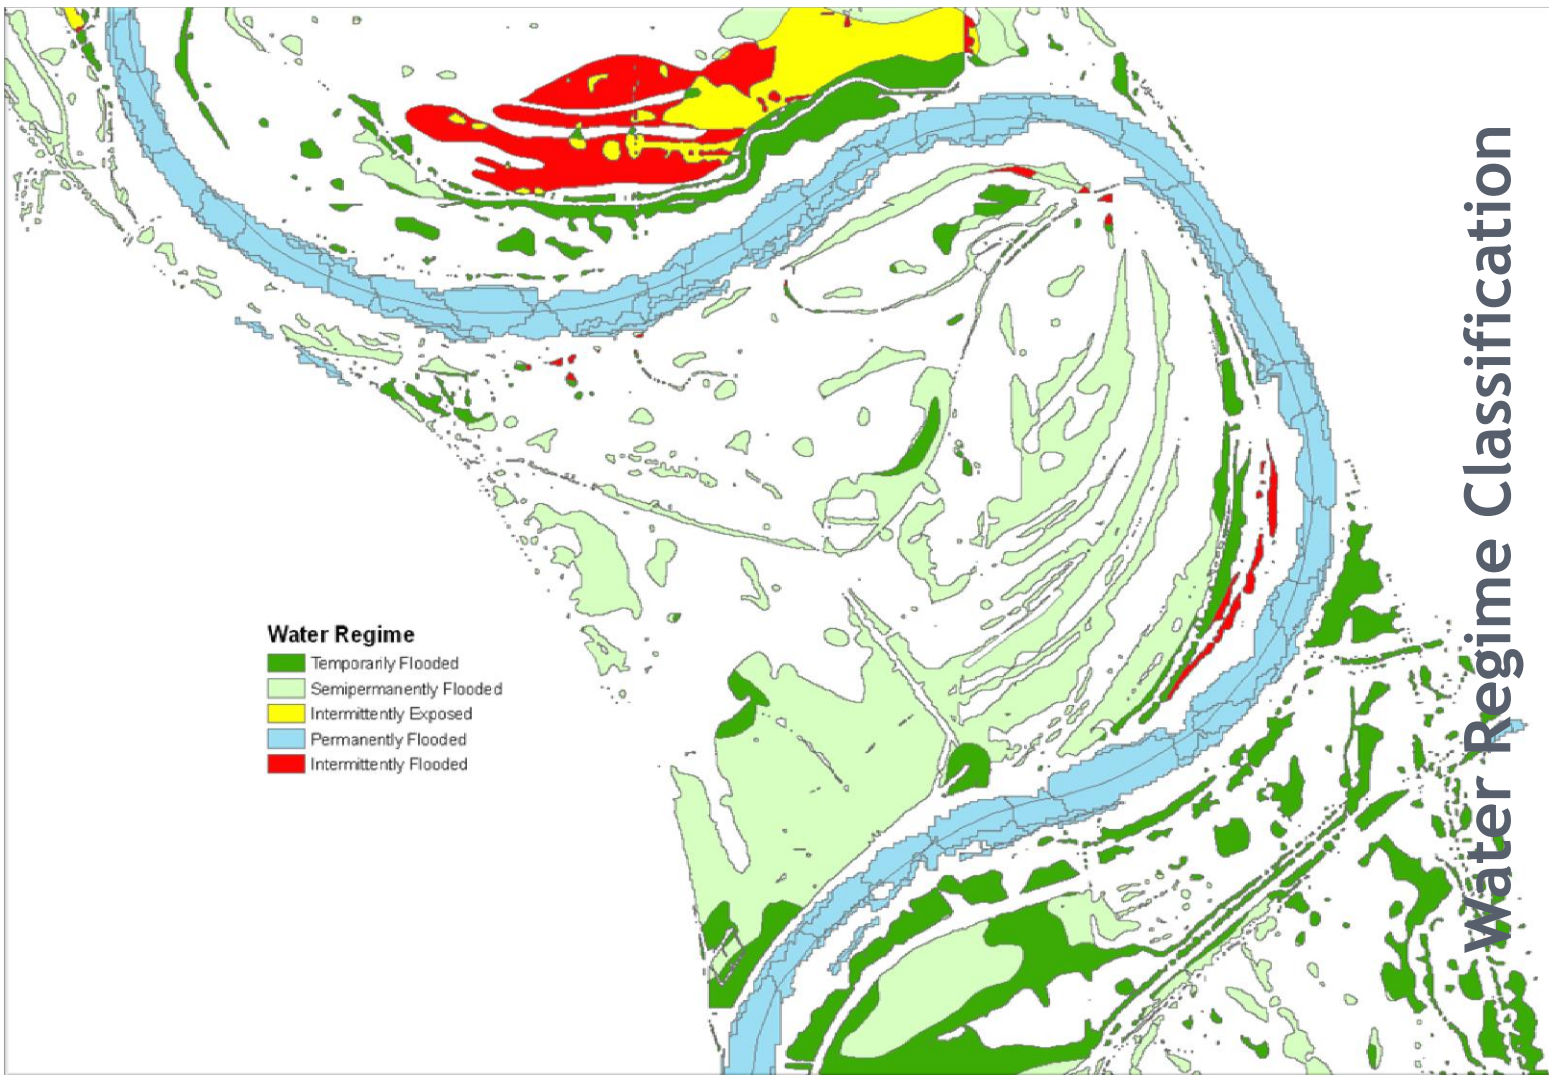

Union of  
SSURGO  
drainage class  
and DEM  
developed sinks

## Water Regime Classification

Permanently  
flooded  
developed  
through object  
classification

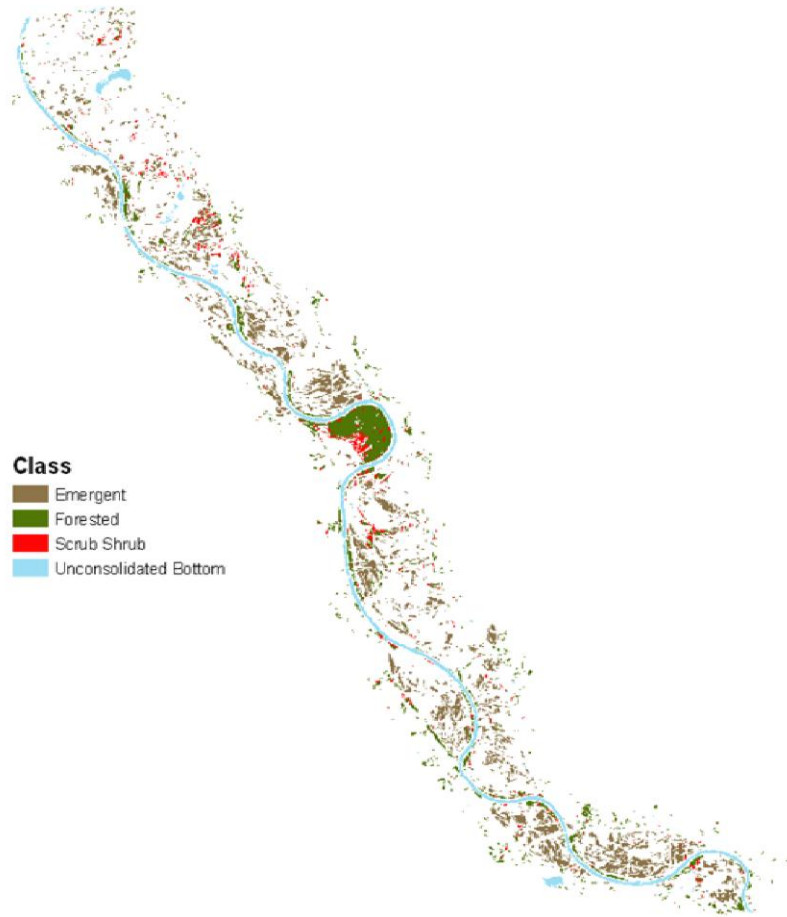

Water regime  
created by  
combining  
permanently  
flooded and  
SSURGO/DEM  
data

## Wetland System Classification

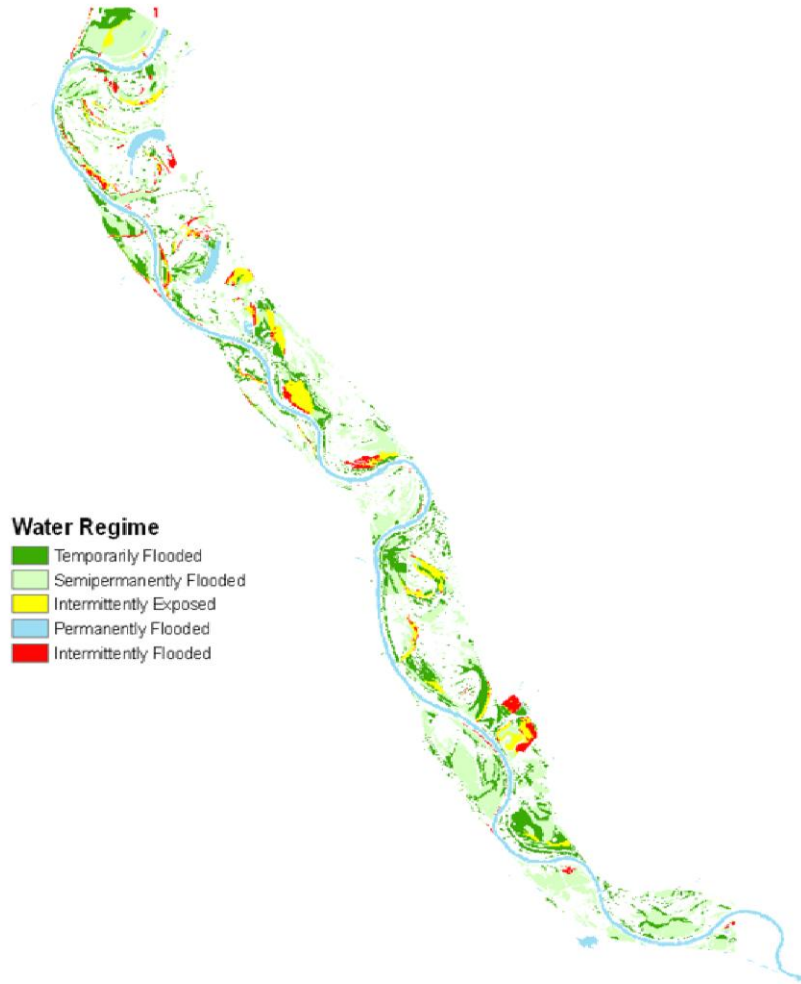

Final wetland  
system  
classification

## Wetland Class Classification

Final wetland  
class  
classification

## Water Regime Classification

Final water  
regime  
classification

## Wetland Classification

Concatenate all attribute fields to arrive at wetland codes

## Wetland Classification

# Conclusion

- Have demonstrated that wetland types can be mapped through object oriented classification of satellite acquired remotely sensed information
- Technique shows promise and has the capability to be applied to regional/national level mapping activities
